

Ports

Accessibility, safety, and horizontal marking materials

Safe, sustainable and efficient mobility

The solution

All you need for your accessibility, safety and horizontal marking requirements

When it comes to ensuring the safety of pedestrians and the visually impaired, there are special considerations to be made especially in public transport hubs.

For people with impaired eyesight, it is difficult to move around safely without the right guidance. Therefore, we offer a wide selection of tactile products that guide the visually impaired safely on their way when travelling alone.

In order to ensure the safety of pedestrians walking on stairs, steps and other hazardous areas, we also have a wide range of anti-slip and contrast products.

Road maintenance and parking area safety also play a big role in ensuring safety and accessibility in busy and bustling areas such as ports. Therefore, our complete solution includes road and surface repair materials as well as parking area markings.

TACTILE MARKINGS

We offer two different types of tiles which makes it possible to navigate the areas in a safe and comfortable way - TacPad™ and TacGuide™. With each of their tactile properties, these markings can help guide blind and visually impaired people and provide slip- and skid-resistant surfaces for improved safety.

SAFETY MARKINGS

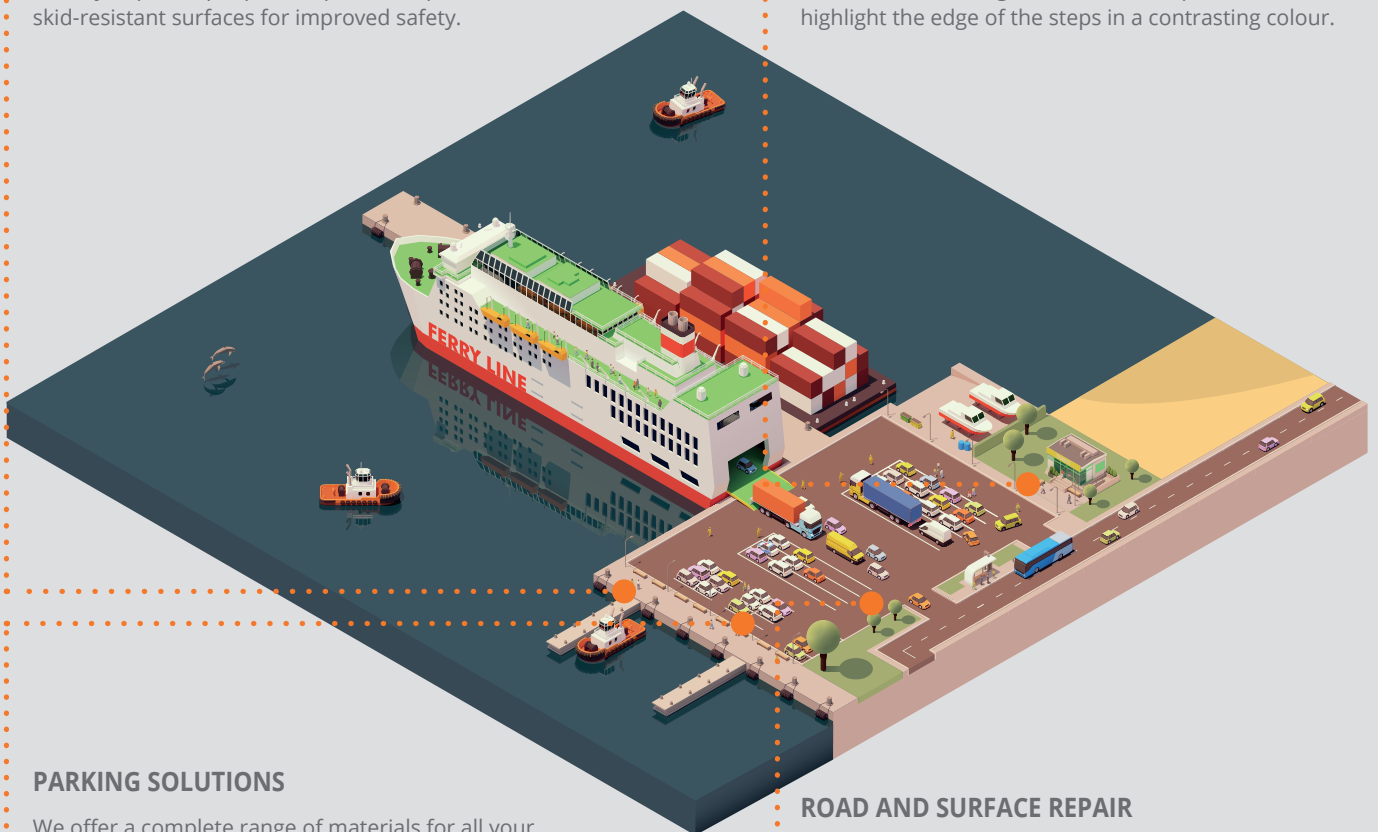

Slippery steps can be the cause of serious accidents - but these can be avoided with PREMARK™ Antiskid. This highly skid-resistant preformed thermoplastic material is a great way of safe-proofing slippery substrates. It also works well as 'nosing' on stairs and steps where it can highlight the edge of the steps in a contrasting colour.

PARKING SOLUTIONS

We offer a complete range of materials for all your horizontal markings for parking bays. With our colourful plural components you can make parking bays stand out while adding skid-resistance to the surface. Our PREMARK™ symbols are known for their high durability and go perfectly on top of brightly coloured surfaces creating eye-catching and practical traffic area solutions.

ROAD AND SURFACE REPAIR

To keep roads and pavements safe, proper maintenance is required. This not only helps limit the risk of extended damages, but also decreases the need for more extensive and costly repairs. Most importantly, regular road repairs increase safety. The simple and fast application processes of our ChipFill™ and ColdFill™ materials means that repairs can be done in minutes.

Tactile markings

Provide equal access for everyone, everywhere

Given their disability, visually impaired people often need additional orientation aids to be able to move around safely when travelling alone. For this purpose, our tactile markings offer an ideal solution. With perceptible warnings, these markings convey vital information on how to navigate if you are blind or have impaired eyesight.

Inclusive infrastructure made easy

Common for our tactile markings is that they can be applied directly on top of the existing surface. Cutting the material is easy and makes it possible to shape it around curves or street furniture if necessary. As there is no need to break up or re-arrange the surface, they provide an easy way of achieving a more inclusive infrastructure.

Pedestrian crossings

In areas with heavy traffic, there is an added risk of accidents for people with impaired eyesight, especially at crossings. Here, the domed TacPad™ markings highlight the transition from the pedestrian route to the road, while the raised lines of TacGuide™ provide a perceptible line to follow to navigate safely through the area.

Bridges and stairs

Tactile markings are essential on areas where there is a hazard, here they both warn and guide the visibly impaired. By using the domed TacPad to alert people to the upcoming hazard, so that care can be taken when they are navigating areas such as stairs, then you are then able to direct them safely with the ribbed TacGuide.

Walkways

As the name indicates, our TacGuide products can help guide people through traffic. When running alongside a path or walkway, the raised lines of TacGuide indicate where it is safe to walk. By staying close and following the lines with their cane, blind and visually impaired pedestrians can steer clear of obstacles and hazards.

Safety markings

Increase friction and awareness on exposed areas

With our range of safety markings, we put a specific focus on creating safe conditions for all. This is especially the case in areas where there is an increased risk of accidents. Many of these risks can be reduced with the proper markings, so why not make sure to safe-proof them before it is too late.

Safety first

Safety is not something that should be taken lightly. We offer a full range of products that provide a skid-resistant surface to minimise the risk of slip-and-fall accidents. This prevents the markings from becoming slippery and offers you the level of safety you can expect from premium markings.

Stairways and steps

With our range of PREMARK™ Antiskid products, you can easily add anti-skid 'noses' on stairs and steps to help prevent slip-and-fall accidents. Apart from creating a skid-resistant surface, PREMARK Antiskid products can also add contrast by highlighting the edge of the steps in a different colour. This makes it easier to visually differentiate each step.

Restricted areas

For warning and directional signs PREMARK™ is the ideal material for creating horizontal signage. The durability of the material ensures a long service life that can last 6-8 times longer than painted markings. PREMARK™ can also be designed to your requirements and offers an easy and effective solution in guiding pedestrians and road users.

Walkways

For safe-proofing walkways in public areas or on factory grounds, we recommend our PlastiRoute™ products. The bright colours of these materials make the walkways easy to follow - and the skid-resistant surface makes them safe to walk on. PlastiRoute can be combined with PREMARK symbols and signs for further pedestrian guidance.

Product spotlight

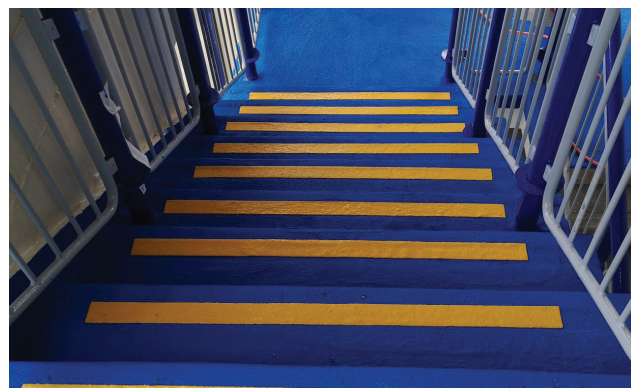

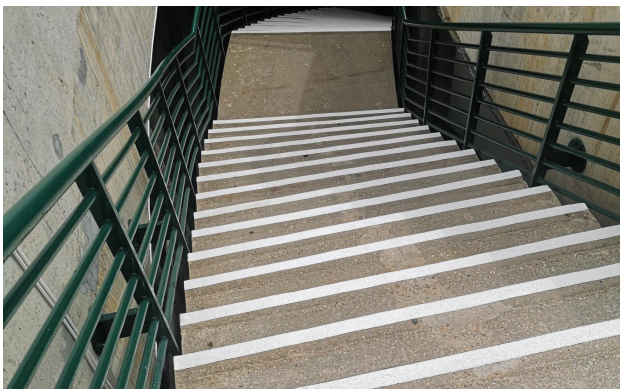

PREMARK™ Antiskid

Increase pedestrian safety by creating slip-resistant surfaces

PREMARK Antiskid are preformed anti-skid lines and sheets that increase safety both visually and physically by creating slip-resistant surfaces with coloured contrasts.

We recommend it for stairs, steps, and slippery surfaces such as manhole covers.

- Increases safety on hazardous areas by adding skid-resistance that prevents slip-and-fall accidents.
- Depending on the need at hand, PREMARK Antiskid is available in both lines and sheets making it suitable for different types of applications and surfaces.
- PREMARK Antiskid can be applied by heating the material thus creating a durable bond with the substrate.
- Can be combined with PlastiRoute™ in order to create a complete solution for colour coding or marking restricted areas with a dirt resistant and durable result.

Parking solutions

Provide clear guidance in parking areas

Whether you are a driver looking for the nearest parking spot or a pedestrian trying to get safely across the area, busy parking lots can be difficult to navigate around. But it doesn't have to be this way! With a combination of our easily-applied products, you can make it both easier and safer for people to find their way around your parking area.

With more and more electric cars hitting the road, there is an ever-increasing need for more charging stations. We believe that finding the nearest place to charge your car is much easier when the parking space is easy to identify from the other parking bays. We have a range of materials that will help you achieve that, from colourful demarcation to clear, recognisable symbols and signs.

Colour demarcation

By using bright colours, you can make it easier for people to identify the purpose of each area on the parking lot. We recommend using our PlastiRoute™ materials for this purpose. With these colourful materials you can make handicap spots, e-charging bays and family parking spaces stand out - or perhaps mark a safe pathway for pedestrians to follow.

Preformed parking signage

Our PREMARK™ products are the go-to-solution for marking your parking area with recognisable signage. Whether you are looking for handicap or e-parking symbols, lines to separate each parking space, or arrows to provide guidance, these markings can help make it easy and safe to navigate the area. The pre-cut markings are fast to apply and can be combined with a coloured surface.

Lining

Lines on the parking lot is necessary to mark out the individual parking stalls. A clear separation makes it easy to navigate the parking lot which helps to avoid confusion and keep the traffic flow organised. This is easily done with our PREMARK lines that separate each parking stall in no time and with a durable result.

Road and surface repair

Keep the roads safe with our innovative and complementing range of products

Worn and damaged roads are unfortunately not a rare sight. Potholes, cracks, and other damages on the road can be caused by a number of factors including water intrusion, heavy vehicles, as well as seasonal temperature changes.

In order to keep the roads safe, it is critical to keep up with proper maintenance to prevent these damages from spreading or forming. This not only helps limit the risk of extended damages, but also the need for more extensive and costly repairs. Most importantly, however, regular repairs prolong the lifetime of the road and increase safety.

Potholes

Potholes on the road can be safety hazards and must be attended to quickly in order to avoid accidents. Depending on the size of the road damage, we recommend using our hot-applied surface defect repair ChipFill™ on its own or in combination with AggreFill™. These two specially designed products provide a fast and easy repair of the road with a minimal downtime of traffic.

Joints and edges

Sometimes the road is in need of a helping hand. In these situations, BandFill™ provides an efficient "first aid". These light weight strips with high anti-skid properties can be used for sealing cracks in the road surface as well as the edges of repaired asphalt areas. The flexible product is available in both lines and rolls - depending on the job at hand.

Cracks and damage

ColdFill™ is liquid road repair ideal for longitudinal cracks and levelling out larger surfaces that suffers from irregular damages. The self-levelling product ensures both quick and durable repairs that will prolong the lifetime of the surface.

Marking the future with you
